### Introduction

■ Gate-level minimization refers to the design task of finding an optimal gate-level implementation of Boolean functions describing a digital circuit

### Review of Boolean Function

#### Boolean function

- Sum of minterms (or product of maxterms) canonical form
  - » Another form of truth table representation
- Sum of products (or product of sums) standard form
  - » A circuit with less hardware resource in the simplest form
    - Minimum number of terms
    - Minimum number of literals
  - » The simplified expression may not be unique

## The Map Method

- **■** The complexity of the digital logic gates
  - The complexity of the algebraic expression
- Logic minimization
  - Algebraic approach is lack of specific procedure applying the theorems
  - The Karnaugh map
    - » A simple straight forward procedure
    - » A pictorial form of a truth table
    - » Applicable if the # of variables  $\leq$  6
- A diagram made up of squares
  - Each square represents one minterm

## Two-Variable Map

### A two-variable map

## A Three-Variable Map

### A three-variable map

- Eight minterms
- The Gray code sequence
- Any two adjacent squares in the map differ by only one variable
  - » Primed in one square and unprimed in the other
  - » e.g.,  $m_5$  and  $m_7$  can be simplified
  - $m_5 + m_7 = xy'z + xyz = xz(y' + y) = xz$

## Prime Implicants

- Design objectives
  - All the minterms must be covered
  - Minimize the number of terms
- Prime Implicant (PI)
  - PI: A product term obtained by combining the maximum possible number of adjacent squares in Karnaugh map
  - Essential PI: a minterm is covered by only one prime implicant
    - » The essential PI must be included

# Product of Sums Simplification

#### Approach #1

- Simplified F' in the form of sum of products
- ◆ Apply DeMorgan's theorem F = (F')'
- $\bullet$  F': sum of products  $\rightarrow$  F: product of sums

### Approach #2: duality

- Combinations of maxterms (it was minterms)
- $igoplus M_0M_1 = (A+B+C+D)(A+B+C+D') = (A+B+C)+(DD') = A+B+C$

### Product of Maxterms Procedure

#### Consider the function defined in Table 1

In sum-of-minterm:

$$F(x, y, z) = \sum (1, 3, 4, 6)$$

In product-of-maxterm:

$$F(x, y, z) = \Pi(0, 2, 5, 7)$$

**Table 3.1** *Truth Table of Function F* 

X	y	Z	F
0	0	0	0
0	0	1	1
0	1	0	0
0	1	1	1
1	0	0	1
1	0	1	0
1	1	0	1
1	1	1	0

### Product of Sums Procedure

#### Consider the function defined in Table 1

Combine the 1's:

$$F(x, y, z) = x'z + xz'$$

Combine the 0's:

$$F'(x, y, z) = xz + x'z'$$

Taking the complement of F'

$$F(x, y, z) = (x' + z')(x + z)$$

### Don't-Care Conditions

- The value of a function is not specified for certain combinations of variables
  - BCD; 1010-1111: don't care
- The don't-care conditions can be utilized in logic minimization
  - Can be implemented as 0 or 1

**Example 8:** simplify  $F(w, x, y, z) = \Sigma(1, 3, 7, 11, 15)$  which has the don't-care conditions  $d(w, x, y, z) = \Sigma(0, 2, 5)$ 

# Example 8 (cont.)

- ightharpoonup F = yz + w'x'; F = yz + w'z
- $\bullet$   $F = \Sigma(0, 1, 2, 3, 7, 11, 15); <math>F = \Sigma(1, 3, 5, 7, 11, 15)$
- Either expression is acceptable

# Two-level Implementation

#### ■ Two-level logic

- NAND-NAND = sum of products
- **♦** Example: *F* = *AB+CD*
- F = ((AB)' (CD)')' =AB+CD

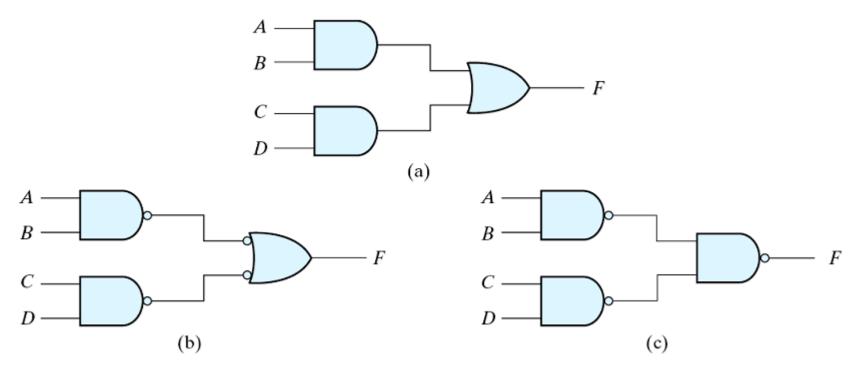

Figure 18 Three ways to implement F = AB + CD

### **Example 9: implement** F(x, y, z) **with NAND gates:**

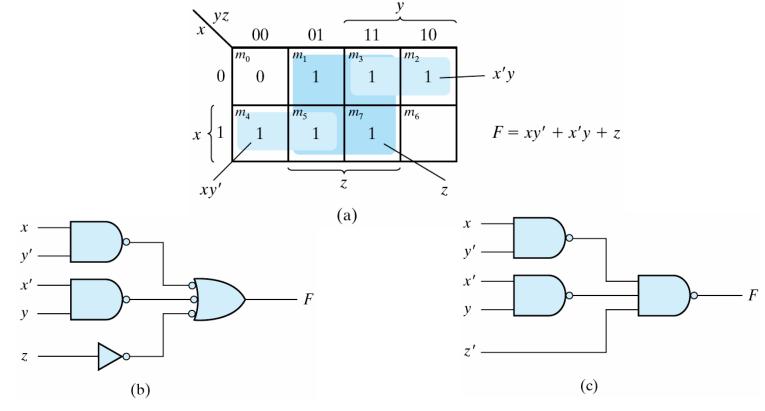

Figure 19 Solution to Example 9

### Procedure with Two Levels NAND

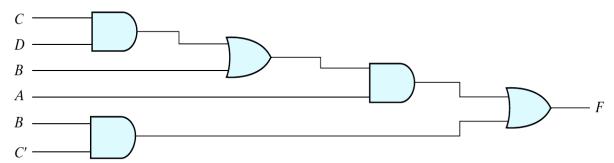

### The procedure

- Simplified in the form of sum of products;
- A NAND gate for each product term; the inputs to each NAND gate are the literals of the term (the first level);
- A single NAND gate for the second sum term (the second level);
- A term with a single literal requires an inverter in the first level

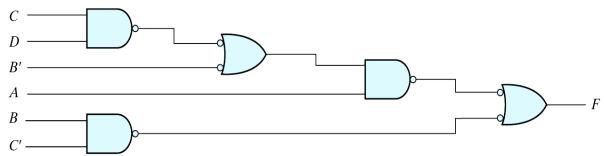

### Multilevel NAND Circuits

#### Boolean function implementation

- ◆ AND-OR logic → NAND-NAND logic
  - » AND → NAND + inverter
  - » OR: inverter + OR = NAND
